

The textures aren't showing?

1, Above the viewport panel, please make sure the “**Hardware texturing**” button is turned on. If you can't find the button or the menu, try hot key “shift+m”, or “ctrl+m”, or “ctrl+shift+m”. These hot keys will toggle the visibility of the menu and shelves.

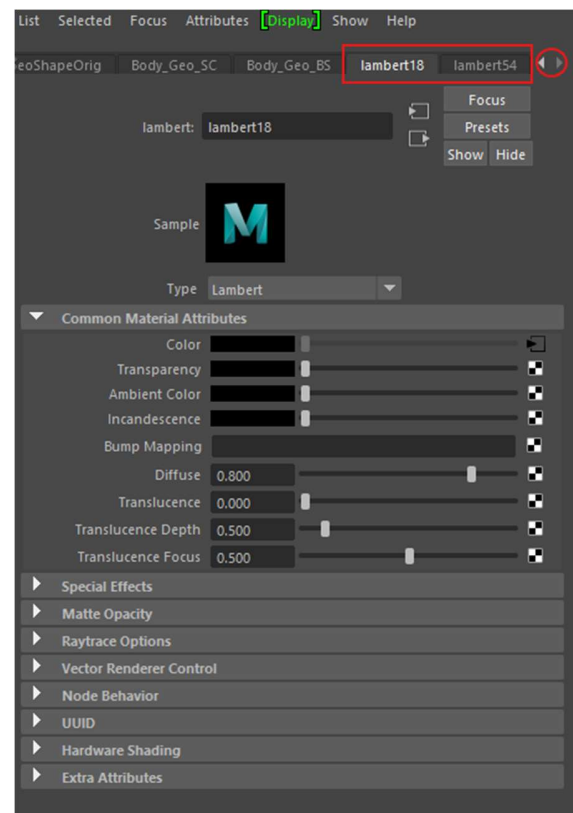

2, Make sure you copied the texture files.

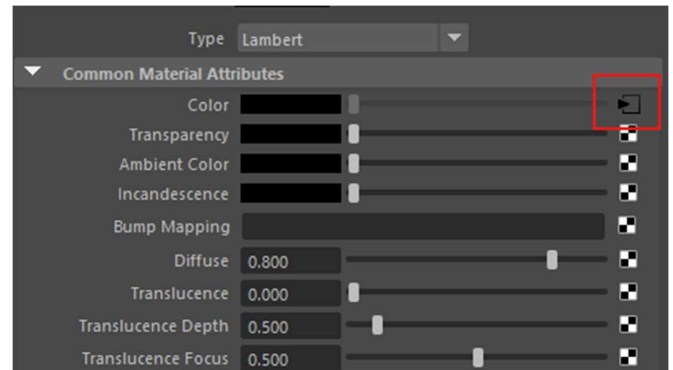

- You can save the texture files anywhere you want, but **we recommend you save the files under the sourceimages folder or the same folder you save the rig file.** Maya might be able to find them automatically without additional actions.

3, Make sure you set the texture file path in Maya correctly.

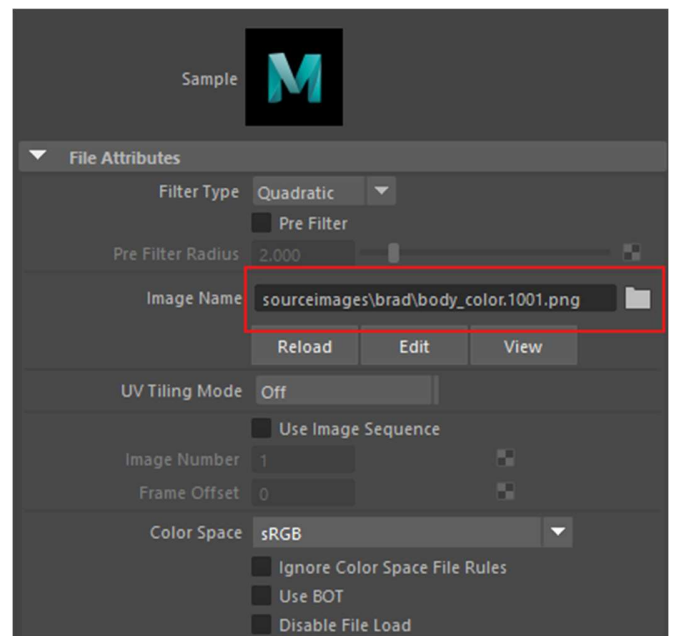

- Select the body polygon, **hold “Ctrl” and hit “A” key.** You should be able to find the model and its related nodes in **Attribute Editor**. Please click or right click the triangle button on right top of the attribute editor to find the shading nodes.

- Besides the “Color” attribute, click the arrow button. You should be able to see the file node which link to the texture.

- Besides the “Image Name” attribute, please make sure the value is the file path where you saved the texture files.
- We use two lambert shaders for the body polygon, so please double check both.
